prefabrication would have increased the probability of sprinklers accidentally breaking during stacking operations (loading and unloading pallets in a rack).

This technical prefabrication innovation is a solution patented by PROFAB – UXELLO FABRICATION and certified FM APPROVAL.

It offers specific advantages to our clients. No other attachments nor welding prevent such risk of leaks.

The initial inspection of the network is made easy: the presence of a sprinkler head guarantees the presence of the drilling.

For our industrial customers, the compact design due to the absence of welded connections is a major asset.
